Brute-force substring search: Java implementation

Check for pattern starting at each text position.

| i | j | i+j | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|---|---|-----|---|---|---|---|---|---|---|---|---|---|----|
| | | | A | B | A | C | A | D | A | B | R | A | C |
| 4 | 3 | 7 | | | | | A | D | A | C | R | | |
| 5 | 0 | 5 | | | | | A | D | A | C | R | | |

```
public static int search(String pat, String txt)
{
    int M = pat.length();
    int N = txt.length();
    for (int i = 0; i <= N - M; i++)
    {
        int j;
        for (j = 0; j < M; j++)
            if (txt.charAt(i+j) != pat.charAt(j))
                break;
        if (j == M) return i;
    }
    return N;
}
```

← index in text where pattern starts

← not found

Backup

In many applications, we want to avoid **backup** in text stream.

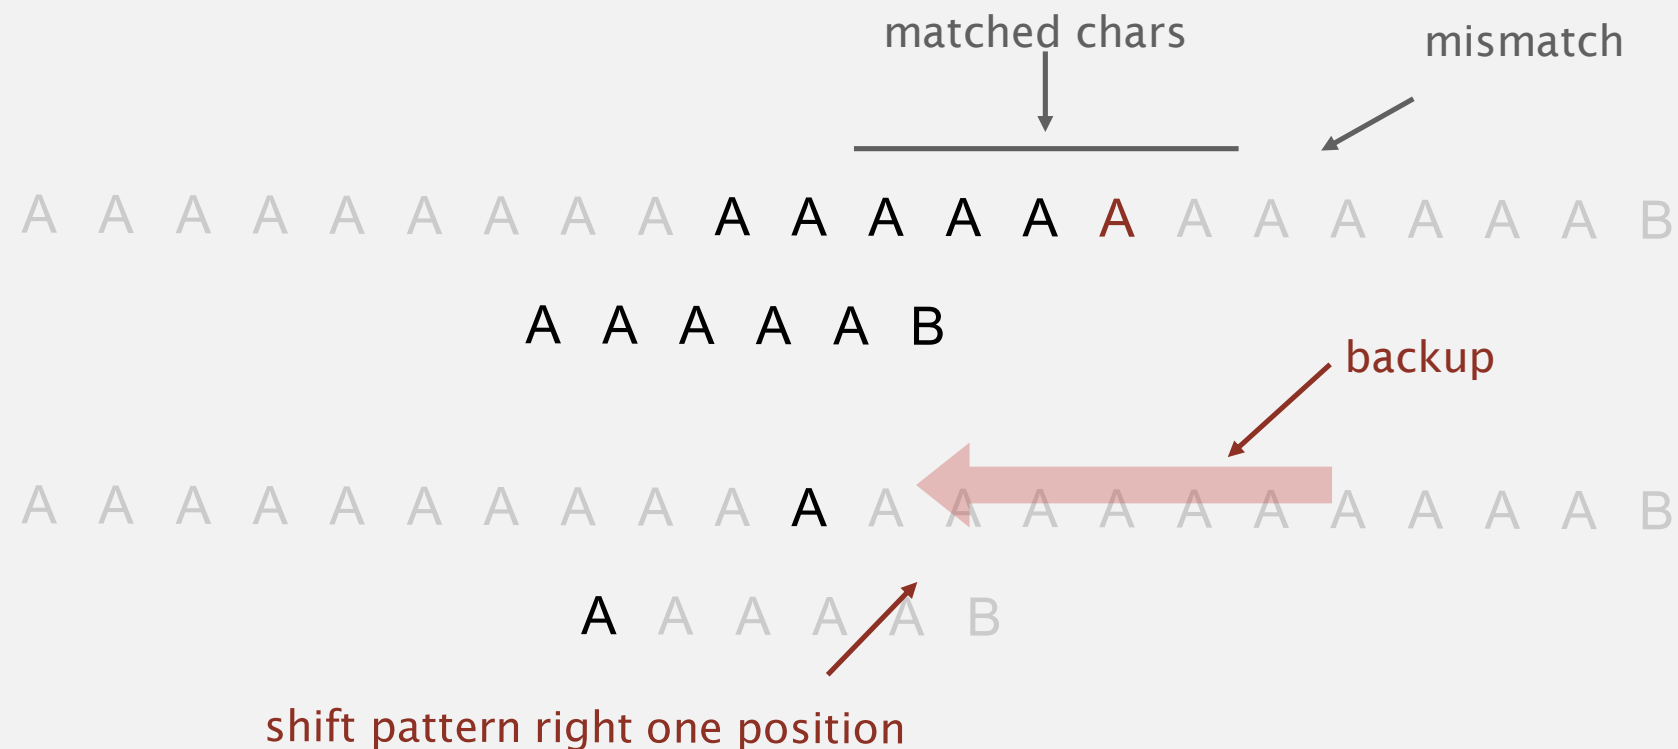

- Treat input as stream of data.
- Abstract model: standard input.

“ATTACK AT
DAWN”
substring search
machine

found

Brute-force algorithm needs backup for every mismatch.

Approach 1. Maintain buffer of last M characters.

Approach 2. Stay tuned.

Algorithmic challenges in substring search

Brute-force is not always good enough.

Theoretical challenge. Linear-time guarantee. ← fundamental algorithmic problem

Practical challenge. Avoid backup in text stream. ← often no room or time to save text

Now is the time for all people to come to the aid of their party. Now is the time for all good people to come to the aid of their party. Now is the time for many good people to come to the aid of their party. Now is the time for all good people to come to the aid of their party. Now is the time for a lot of good people to come to the aid of their party. Now is the time for all of the good people to come to the aid of their party. Now is the time for all good people to come to the aid of their party. Now is the time for each good person to come to the aid of their party. Now is the time for all good people to come to the aid of their party. Now is the time for all good Republicans to come to the aid of their party. Now is the time for all good people to come to the aid of their party. Now is the time for many or all good people to come to the aid of their party. 5.3 SUBSTRING SEARCH

- ▶ *introduction*
- ▶ *brute force*
- ▶ ***Knuth-Morris-Pratt***
- ▶ *Boyer-Moore*
- ▶ *Rabin-Karp*

Deterministic finite state automaton (DFA)

DFA is abstract string-searching machine.

- Finite number of states (including start and halt).
- Exactly one transition for each char in alphabet.
- Accept if sequence of transitions leads to halt state.

internal representation

| j | 0 | 1 | 2 | 3 | 4 | 5 |
|---------------|---|---|---|---|---|---|
| pat.charAt(j) | A | B | A | B | A | C |
| dfa[][j] | A | 1 | 1 | 3 | 1 | 5 |
| | B | 0 | 2 | 0 | 4 | 0 |
| | C | 0 | 0 | 0 | 0 | 6 |

If in state j reading char c :
if j is 6 halt and accept
else move to state $dfa[c][j]$

graphical representation

Knuth-Morris-Pratt demo: DFA simulation

A A B A C A A B A B A C A A

| | | 0 | 1 | 2 | 3 | 4 | 5 |
|---------------|---|---|---|---|---|---|---|
| pat.charAt(j) | | A | B | A | B | A | C |
| dfa[][j] | A | 1 | 1 | 3 | 1 | 5 | 1 |
| | B | 0 | 2 | 0 | 4 | 0 | 4 |
| | C | 0 | 0 | 0 | 0 | 0 | 6 |

Knuth-Morris-Pratt demo: DFA simulation

A A B A C A A B A B A C A A

| | | 0 | 1 | 2 | 3 | 4 | 5 |
|---------------|---|---|---|---|---|---|---|
| pat.charAt(j) | | A | B | A | B | A | C |
| dfa[][j] | A | 1 | 1 | 3 | 1 | 5 | 1 |
| | B | 0 | 2 | 0 | 4 | 0 | 4 |
| | C | 0 | 0 | 0 | 0 | 0 | 6 |

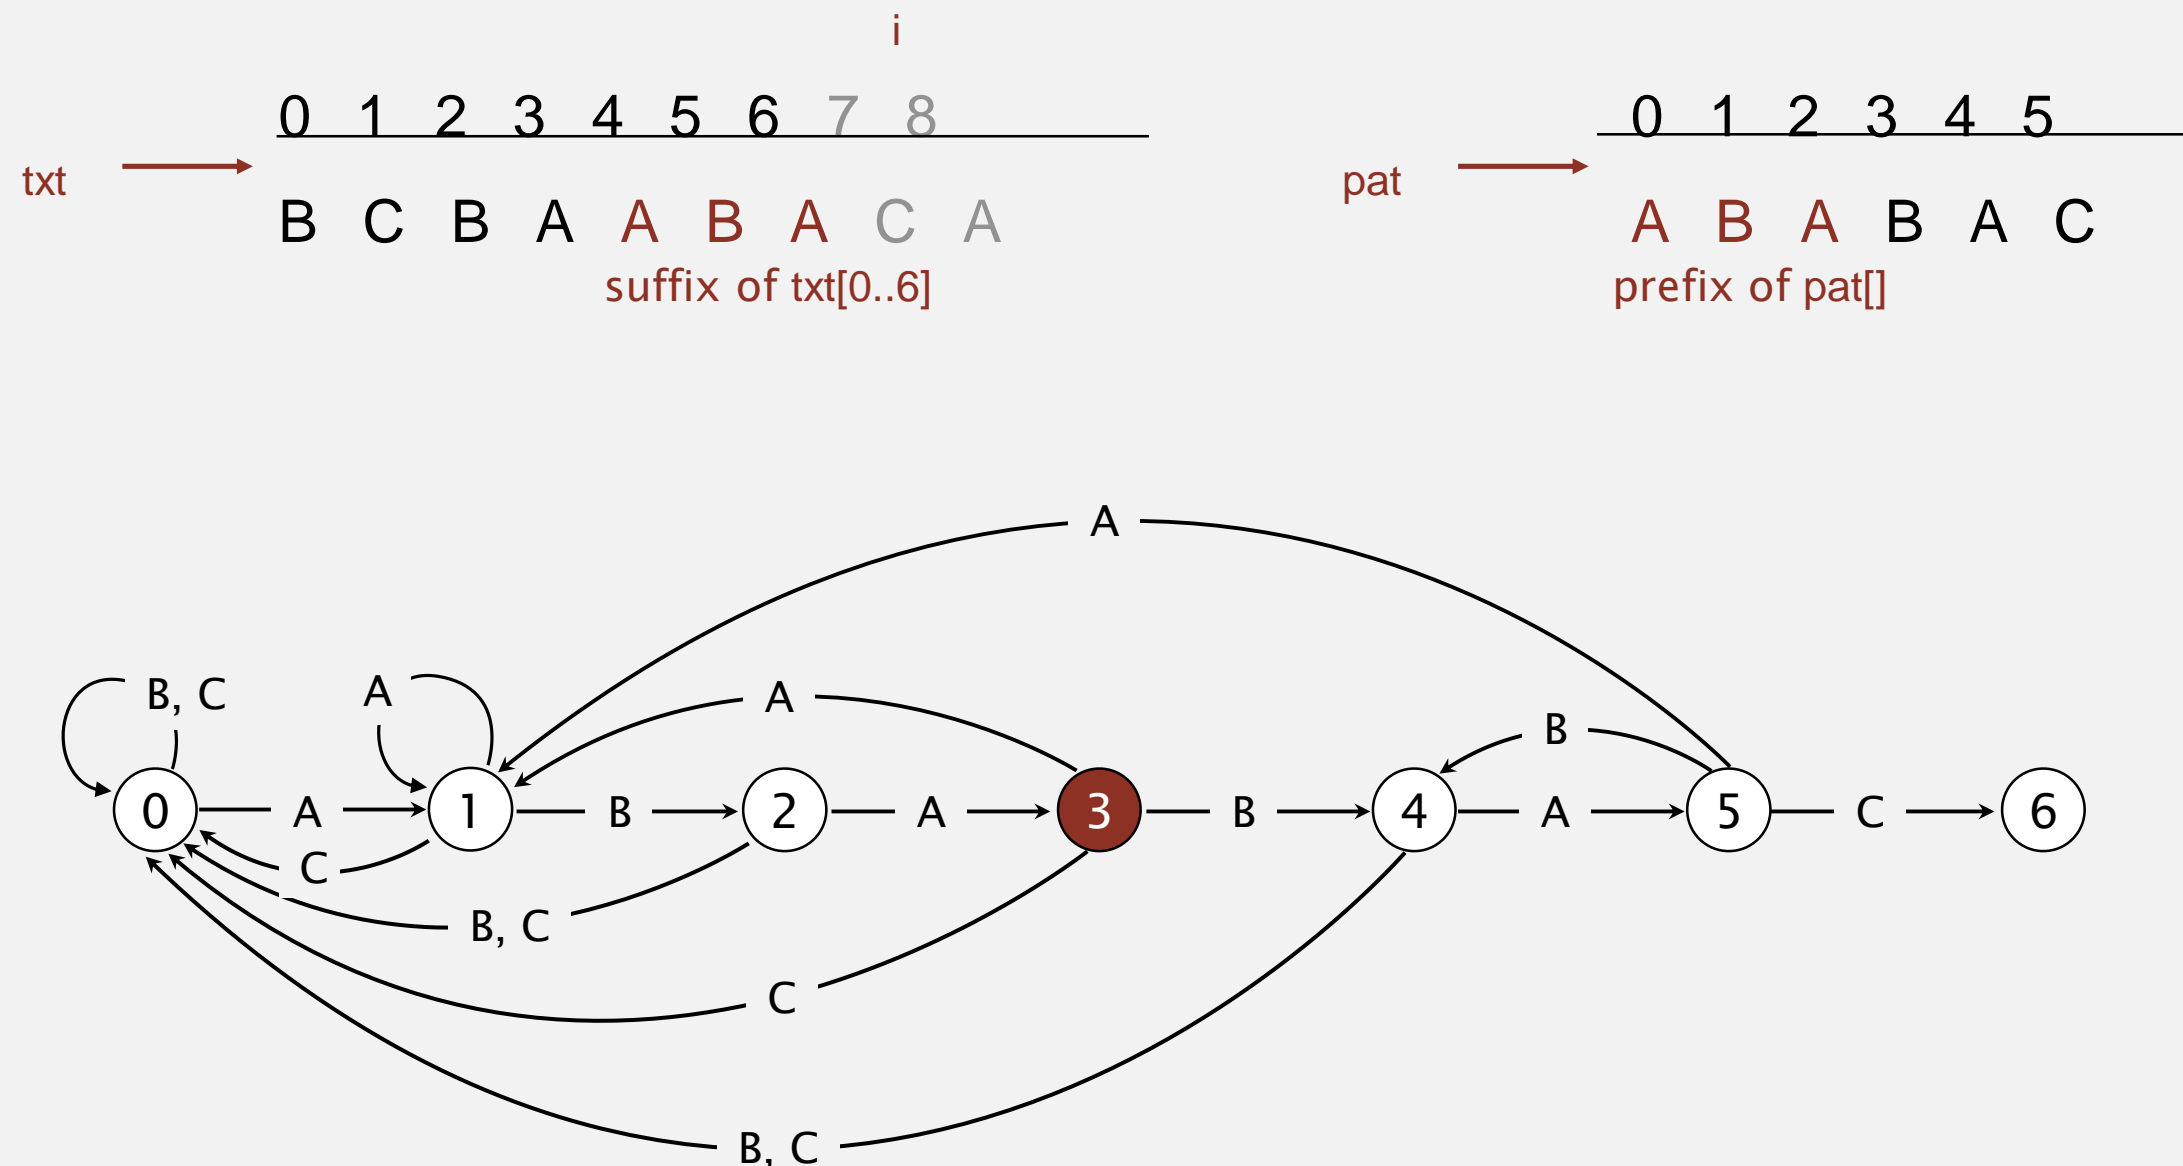

Interpretation of Knuth-Morris-Pratt DFA

Q. What is interpretation of DFA state after reading in $\text{txt}[i]$?

A. State = number of characters in pattern that have been matched.

length of longest prefix of $\text{pat}[]$
that is a suffix of $\text{txt}[0..i]$

Ex. DFA is in state 3 after reading in $\text{txt}[0..6]$.

Knuth-Morris-Pratt substring search: Java implementation

Key differences from brute-force implementation.

- Need to precompute `dfa[][]` from pattern.
- Text pointer `i` never decrements.

```
public int search(String txt)
{
    int i, j, N = txt.length();
    for (i = 0, j = 0; i < N && j < M; i++)
        j = dfa[txt.charAt(i)][j];
    if (j == M) return i - M;
    else      return N;
}
```

← no backup

Running time.

- Simulate DFA on text: at most N character accesses.
- Build DFA: how to do efficiently? [warning: tricky algorithm ahead]

How to build DFA from pattern?

Include one state for each character in pattern (plus accept state).

| | | 0 | 1 | 2 | 3 | 4 | 5 |
|---------------|-----------|---|---|---|---|---|---|
| pat.charAt(j) | dfa[i][j] | A | B | A | B | A | C |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |

0

1

2

3

4

5

6

How to build DFA from pattern?

Match transition. If in state j and next char $c == \text{pat.charAt}(j)$, go to $j+1$.

↑ first j characters of pattern have already been matched ↑ next char matches ↑ now first $j + 1$ characters of pattern have been matched

| | | 0 | 1 | 2 | 3 | 4 | 5 |
|---------------|---|---|---|---|---|---|---|
| pat.charAt(j) | | A | B | A | B | A | C |
| dfa[j][j] | A | 1 | | 3 | | 5 | |
| | B | | 2 | | 4 | | |
| | C | | | | | | 6 |

How to build DFA from pattern?

Mismatch transition. If in state j and next char $c \neq \text{pat.charAt}(j)$, then the last $j-1$ characters of input are $\text{pat}[1..j-1]$, followed by c .

To compute $\text{dfa}[c][j]$: Simulate $\text{pat}[1..j-1]$ on DFA and take transition c .

Running time. Seems to require j steps.

still under construction (!)

Ex. $\text{dfa}['A'][5] = 1;$

$\text{dfa}['B'][5] = 4$

simulate BABA;
take transition 'A'
 $= \text{dfa}['A'][3]$

simulate BABA;
take transition 'B'
 $= \text{dfa}['B'][3]$

| | | | | | | |
|---------------|---|----------|---|---|---|---|
| j | 0 | 1 | 2 | 3 | 4 | 5 |
| pat.charAt(j) | A | <u>B</u> | A | B | A | C |

How to build DFA from pattern?

Mismatch transition. If in state j and next char $c \neq \text{pat.charAt}(j)$, then the last $j-1$ characters of input are $\text{pat}[1..j-1]$, followed by c .

← state X

To compute $\text{dfa}[c][j]$: Simulate $\text{pat}[1..j-1]$ on DFA and take transition c .

Running time. Takes only **constant time if we maintain state X**.

Ex. $\text{dfa}['A'][5] = 1;$

$\text{dfa}['B'][5] = 4$

$X' = 0$

from state X,
take transition 'A'
 $= \text{dfa}['A'][X]$

from state X,
take transition 'B'
 $= \text{dfa}['B'][X]$

from state X,
take transition 'C'
 $= \text{dfa}['C'][X]$

| | | | | | |
|---|----------|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 |
| A | <u>B</u> | A | B | A | C |

Constructing the DFA for KMP substring search: Java implementation

For each state j :

- Copy $\text{dfa}[][X]$ to $\text{dfa}[][j]$ for mismatch case.
- Set $\text{dfa}[\text{pat.charAt}(j)][j]$ to $j+1$ for match case.
- Update X .

```
public KMP(String pat)
{
    this.pat = pat;
    M = pat.length();
    dfa = new int[R][M];
    dfa[pat.charAt(0)][0] = 1;
    for (int X = 0, j = 1; j < M; j++)
    {
        for (int c = 0; c < R; c++)
            dfa[c][j] = dfa[c][X];           ← copy mismatch cases
        dfa[pat.charAt(j)][j] = j+1;         ← set match case
        X = dfa[pat.charAt(j)][X];           ← update restart state
    }
}
```

Running time. M character accesses (but space/time proportional to $R M$).

KMP substring search analysis

Proposition. KMP substring search accesses no more than $M + N$ chars to search for a pattern of length M in a text of length N .

Pf. Each pattern char accessed once when constructing the DFA; each text char accessed once (in the worst case) when simulating the DFA.

Proposition. KMP constructs $\text{dfa}[][]$ in time and space proportional to $R M$.

Larger alphabets. Improved version of KMP constructs $\text{nfa}[]$ in time and space proportional to M .

| 0 | 5 | N | E | E | D | L | E | | | | | | | | | | | | | | | | | | |
| 5 | 5 | | | | | | N | E | E | D | L | E | | | | | | | | | | | | | |
| 11 | 4 | | | | | | | | | | | | N | E | E | D | L | E | | | | | | | |
| 15 | 0 | | | | | | | | | | | | | | | | N | E | E | D | L | E | | | |

\swarrow
return $i = 15$

Boyer-Moore: mismatched character heuristic

Q. How much to skip?

A. Precompute index of rightmost occurrence of character c in pattern.
(-1 if character not in pattern)

```
right = new int[R];  
for (int c = 0; c < R; c++)  
    right[c] = -1;  
for (int j = 0; j < M; j++)  
    right[pat.charAt(j)] = j;
```

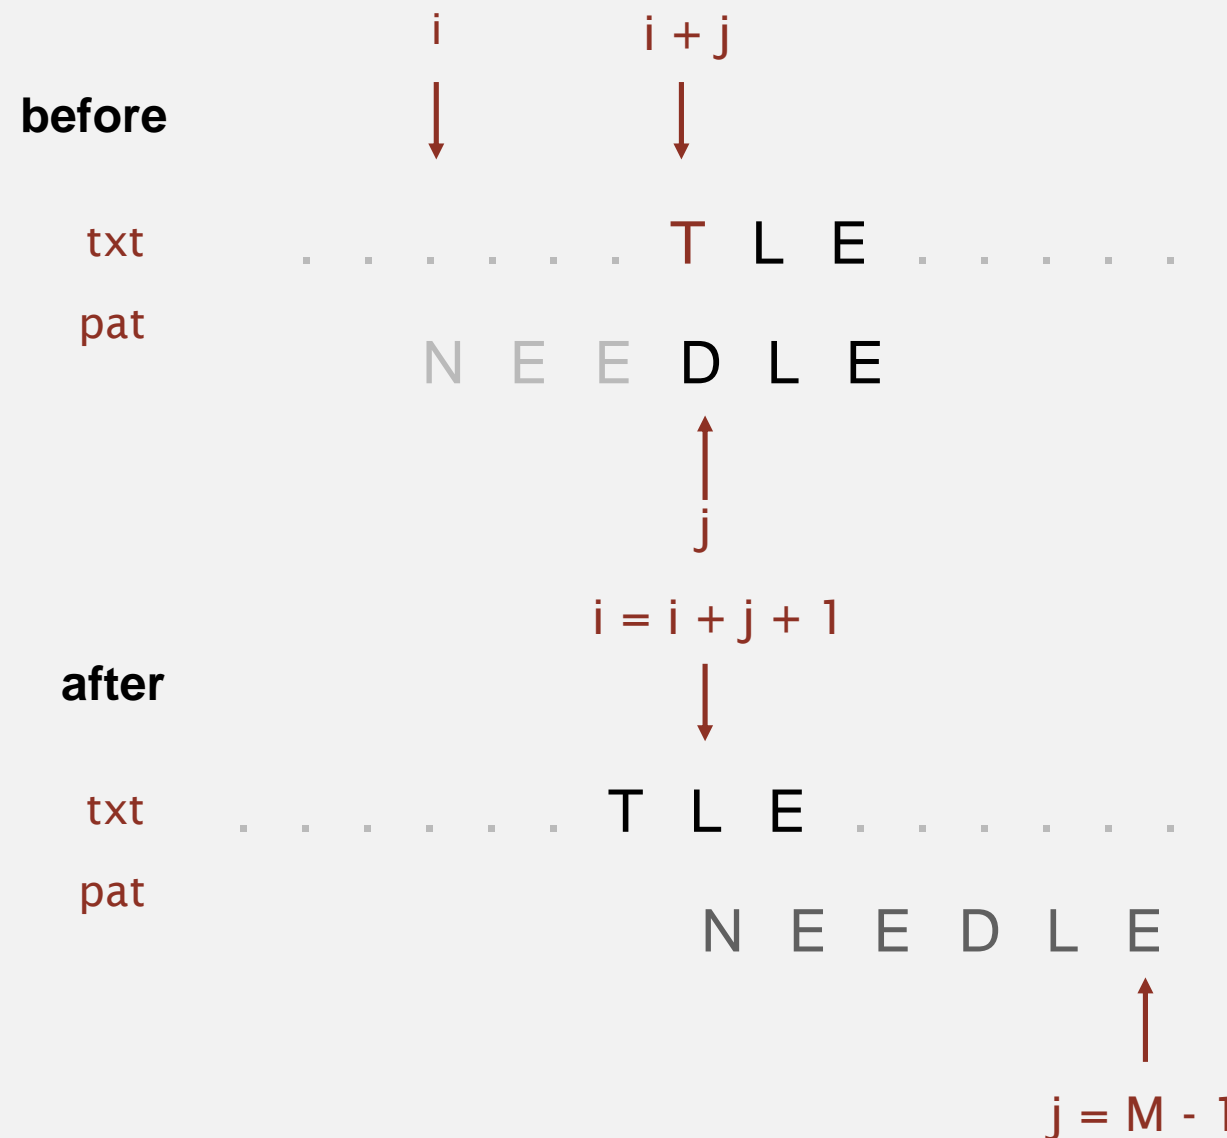

| | | N | E | E | D | L | E | |
|----------|----|----|----|----|----|----|----|-----------------|
| <u>c</u> | | 0 | 1 | 2 | 3 | 4 | 5 | <u>right[c]</u> |
| A | -1 | -1 | -1 | -1 | -1 | -1 | -1 | -1 |
| B | -1 | -1 | -1 | -1 | -1 | -1 | -1 | -1 |
| C | -1 | -1 | -1 | -1 | -1 | -1 | -1 | -1 |
| D | -1 | -1 | -1 | -1 | 3 | 3 | 3 | 3 |
| E | -1 | -1 | 1 | 2 | 2 | 2 | 5 | 5 |
| ... | | | | | | | | -1 |
| L | -1 | -1 | -1 | -1 | -1 | 4 | 4 | 4 |
| M | -1 | -1 | -1 | -1 | -1 | -1 | -1 | -1 |
| N | -1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| ... | | | | | | | | -1 |

Boyer-Moore skip table computation

Boyer-Moore: mismatched character heuristic

Q. How much to skip?

Case 1. Mismatch character not in pattern.

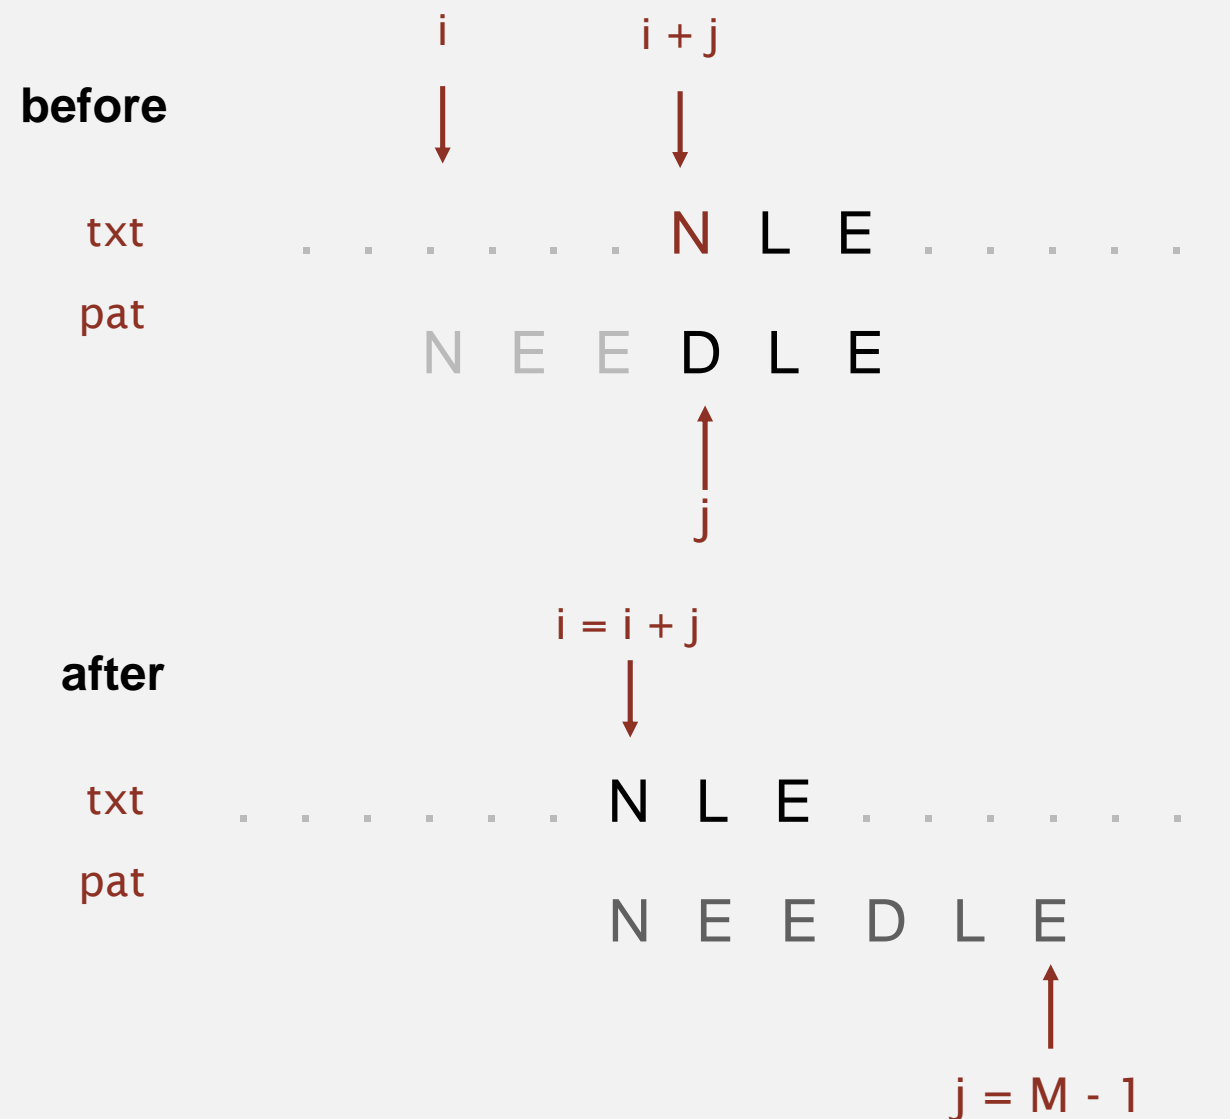

mismatch character 'T' not in pattern: increment i one character beyond 'T'

Boyer-Moore: mismatched character heuristic

Q. How much to skip?

Case 2a. Mismatch character in pattern.

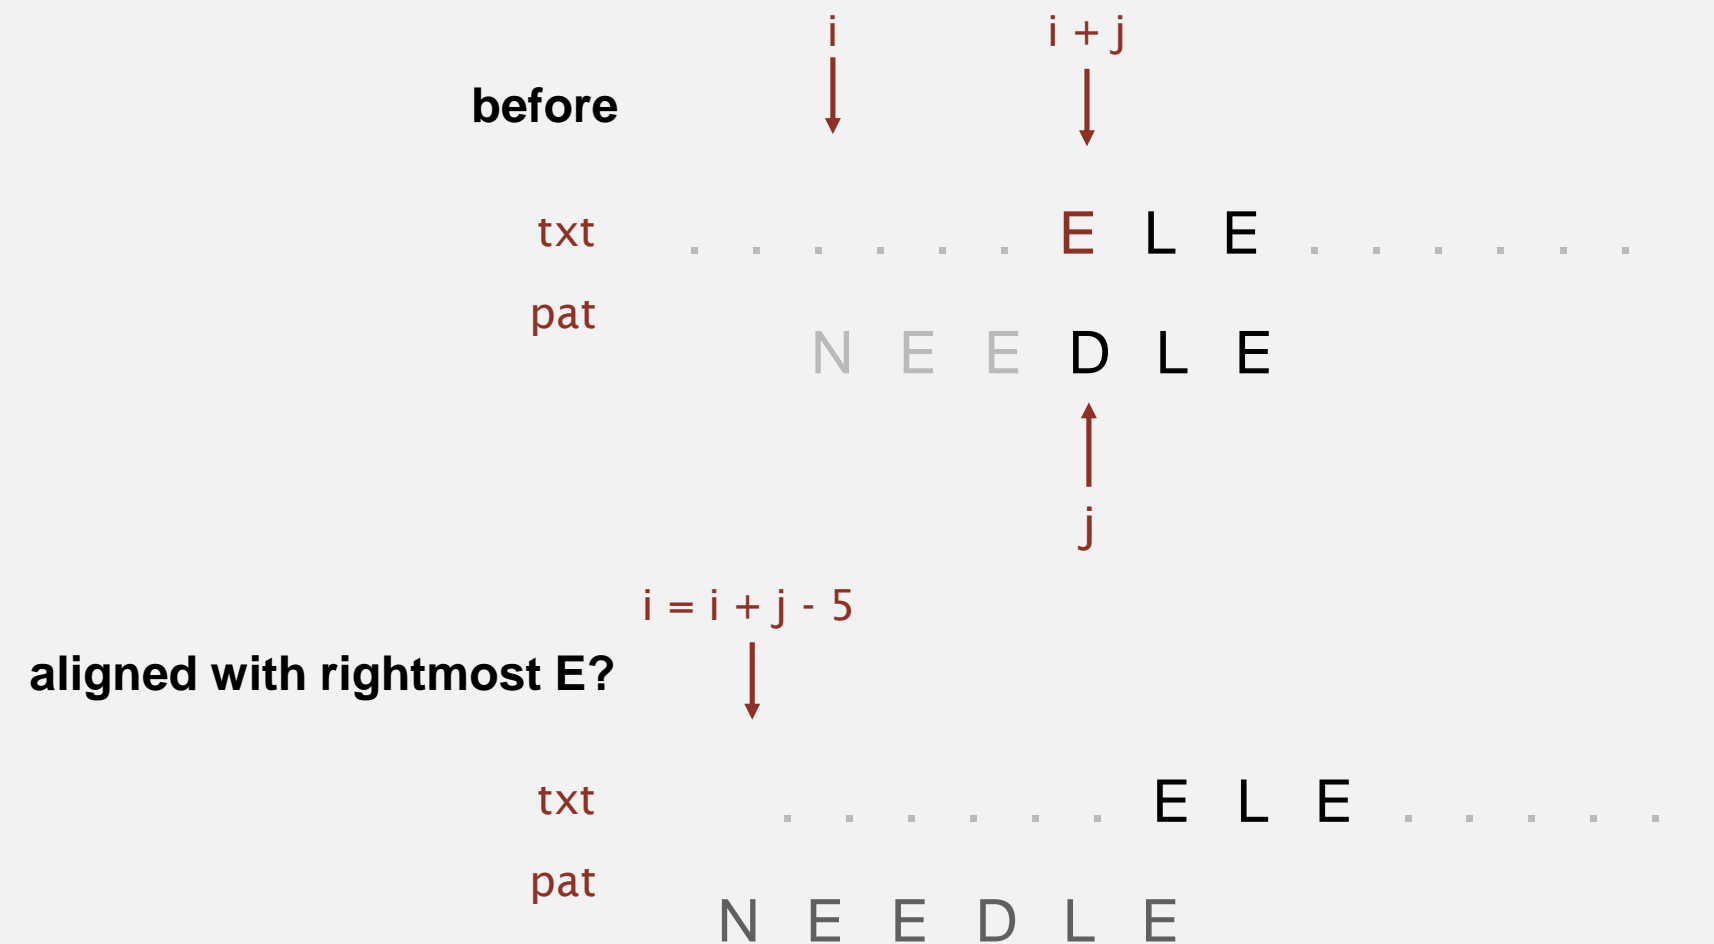

mismatch character 'N' in pattern: align text 'N' with rightmost pattern 'N'

Boyer-Moore: mismatched character heuristic

Q. How much to skip?

Case 2b. Mismatch character in pattern (but heuristic no help).

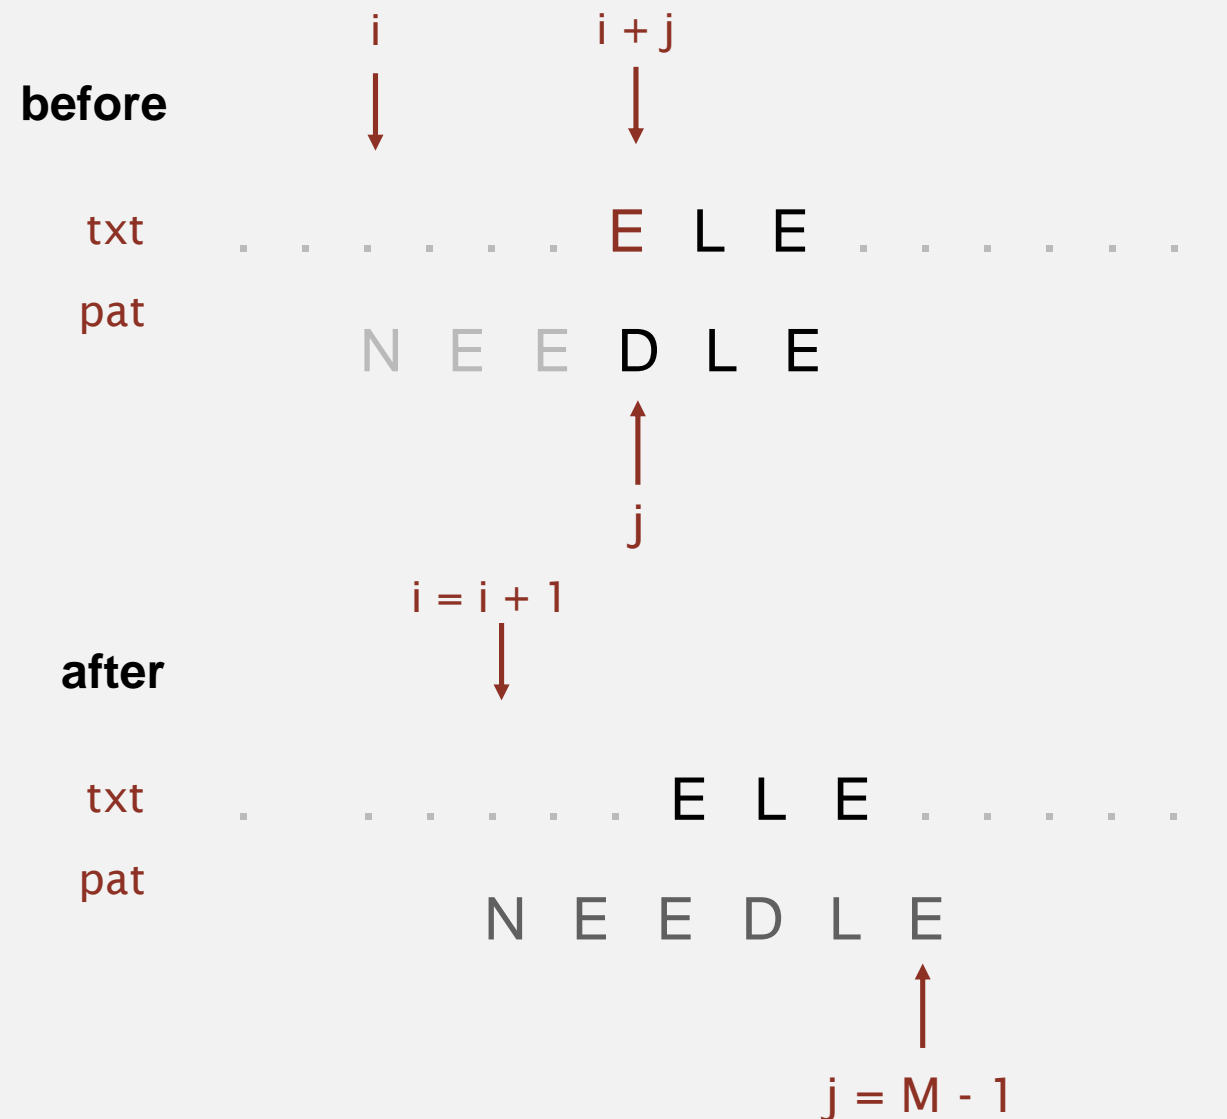

mismatch character 'E' in pattern: align text 'E' with rightmost pattern 'E' ?

Boyer-Moore: mismatched character heuristic

Q. How much to skip?

Case 2b. Mismatch character in pattern (but heuristic no help).

mismatch character 'E' in pattern: increment i by 1

Boyer-Moore: Java implementation

```
public int search(String txt)
{
    int N = txt.length();
    int M = pat.length();
    int skip;
    for (int i = 0; i <= N-M; i += skip)
    {
        skip = 0;
        for (int j = M-1; j >= 0; j--)
        {
            if (pat.charAt(j) != txt.charAt(i+j))
            {
                skip = Math.max(1, j - right[txt.charAt(i+j)]);
                break;
            }
        }
        if (skip == 0) return i;
    }
    return N;
}
```

compute skip value

in case other term is nonpositive

match

Boyer-Moore: analysis

Property. Substring search with the Boyer-Moore mismatched character heuristic takes about $\sim N/M$ character compares to search for a pattern of length M in a text of length N . sublinear!

Worst-case. Can be as bad as $\sim MN$.

| i | skip | | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

5.3 SUBSTRING SEARCH

- ▶ *introduction*
- ▶ *brute force*
- ▶ *Knuth-Morris-Pratt*
- ▶ *Boyer-Moore*
- ▶ *Rabin-Karp*

Michael Rabin
Dick Karp

Rabin-Karp fingerprint search

Basic idea = modular hashing.

- Compute a hash of `pat[0..M-1]`.
- For each `i`, compute a hash of `txt[i..M+i-1]`.
- If pattern hash = text substring hash, check for a match.

| pat.charAt(i) | | | | | | | | | | | | | | | | | |
|---------------|---|---|---|---|---|---------------|-------------|-------------|-------------|-------------|-------------|-------------|----|----|----|----|--|
| i | 0 | 1 | 2 | 3 | 4 | | | | | | | | | | | | |
| | 2 | 6 | 5 | 3 | 5 | % 997 = 613 | | | | | | | | | | | |
| | | | | | | txt.charAt(i) | | | | | | | | | | | |
| i | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | |
| | 3 | 1 | 4 | 1 | 5 | 9 | 2 | 6 | 5 | 3 | 5 | 8 | 9 | 7 | 9 | 3 | |
| 0 | 3 | 1 | 4 | 1 | 5 | % 997 = 508 | | | | | | | | | | | |
| 1 | | 1 | 4 | 1 | 5 | 9 | % 997 = 201 | | | | | | | | | | |
| 2 | | | 4 | 1 | 5 | 9 | 2 | % 997 = 715 | | | | | | | | | |
| 3 | | | | 1 | 5 | 9 | 2 | 6 | % 997 = 971 | | | | | | | | |
| 4 | | | | | 5 | 9 | 2 | 6 | 5 | % 997 = 442 | | | | | | | |
| 5 | | | | | | 9 | 2 | 6 | 5 | 3 | % 997 = 929 | | | | | | |
| 6 | | | | | | | 2 | 6 | 5 | 3 | 5 | % 997 = 613 | | | | | |

match ↗

6 ← return i = 6

modular hashing with $R = 10$ and $\text{hash}(s) = s \pmod{997}$

Modular arithmetic

Math trick. To keep numbers small, take intermediate results modulo Q .

Ex.

$$\begin{aligned} & (10000 + 535) * 1000 \pmod{997} \\ & \quad \swarrow \quad \searrow \\ & 10000 \pmod{997} = 30 \quad 1000 \pmod{997} = 3 \\ & = (30 + 535) * 3 \pmod{997} \\ & = 1695 \pmod{997} \\ & = 698 \pmod{997} \end{aligned}$$

$$(a + b) \pmod{Q} = ((a \pmod{Q}) + (b \pmod{Q})) \pmod{Q}$$

$$(a * b) \pmod{Q} = ((a \pmod{Q}) * (b \pmod{Q})) \pmod{Q}$$

two useful modular arithmetic identities

Efficiently computing the hash function

Modular hash function. Using the notation t_i for `txt.charAt(i)`, we wish to compute

$$x_i = t_i R^{M-1} + t_{i+1} R^{M-2} + \dots + t_{i+M-1} R^0 \pmod{Q}$$

Intuition. M -digit, base- R integer, modulo Q .

Horner's method. Linear-time method to evaluate degree- M polynomial.

| | pat.charAt() | | | | |
|---|--------------|-----------|-------------------------------|---------------------------------|------------------------------------|
| i | 0 | 1 | 2 | 3 | 4 |
| | 2 | 6 | 5 | 3 | 5 |
| 0 | 2 | % 997 = 2 | | | |
| 1 | 2 | 6 | % 997 = (2*10 + 6) % 997 = 26 | | |
| 2 | 2 | 6 | 5 | % 997 = (26*10 + 5) % 997 = 265 | |
| 3 | 2 | 6 | 5 | 3 | % 997 = (265*10 + 3) % 997 = 659 |
| 4 | 2 | 6 | 5 | 3 | 5 % 997 = (659*10 + 5) % 997 = 613 |

```
// Compute hash for M-digit key
private long hash(String key, int M)
{
    long h = 0;
    for (int j = 0; j < M; j++)
        h = (h * R + key.charAt(j)) % Q;
    return h;
}
```

$$\begin{aligned} 26535 &= 2*10000 + 6*1000 + 5*100 + 3*10 + 5 \\ &= (((((2) * 10 + 6) * 10 + 5) * 10 + 3) * 10 + 5 \end{aligned}$$

Efficiently computing the hash function

Challenge. How to efficiently compute x_{i+1} given that we know x_i .

$$x_i = t_i R^{M-1} + t_{i+1} R^{M-2} + \dots + t_{i+M-1} R^0$$

$$x_{i+1} = t_{i+1} R^{M-1} + t_{i+2} R^{M-2} + \dots + t_{i+M} R^0$$

Key property. Can update "rolling" hash function in constant time!

$$x_{i+1} = \underbrace{(x_i}_{\text{current value}} - \underbrace{t_i}_{\text{subtract leading digit}} \underbrace{R^{M-1}}_{\text{multiply by radix}}) + \underbrace{t_{i+M}}_{\text{add new trailing digit}}$$

(can precompute R^{M-1})

| | 1 | ... | 2 | 3 | 4 | 5 | 6 | 7 | ... |
|---------------|---|-----|---|---|---|---|---|---|-----|
| current value | 1 | | 4 | 1 | 5 | 9 | 2 | 6 | 5 |
| new value | | | 4 | 1 | 5 | 9 | 2 | 6 | 5 |
| | | | 4 | 1 | 5 | 9 | 2 | | |
| | | - | 4 | 0 | 0 | 0 | 0 | | |
| | | | | 1 | 5 | 9 | 2 | | |
| | | | | | * | 1 | 0 | | |
| | | | 1 | 5 | 9 | 2 | 0 | | |
| | | | | | | + | 6 | | |

Rabin-Karp substring search example

First R entries: Use Horner's rule.

Remaining entries: Use rolling hash (and % to avoid overflow).

| i | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |
|----|--------------------|-----------|-------------------------------|---------------------------------|----------------------------------|----------------------------------|---|---|---|---|---|---|----|----|----|----|
| | 3 | 1 | 4 | 1 | 5 | 9 | 2 | 6 | 5 | 3 | 5 | 8 | 9 | 7 | 9 | 3 |
| 0 | 3 | % 997 = 3 | | | | | | | | | | | | | | |
| 1 | 3 | 1 | % 997 = (3*10 + 1) % 997 = 31 | | | | | | | | | | | | | |
| 2 | 3 | 1 | 4 | % 997 = (31*10 + 4) % 997 = 314 | | | | | | | | | | | | |
| 3 | 3 | 1 | 4 | 1 | % 997 = (314*10 + 1) % 997 = 150 | | | | | | | | | | | |
| 4 | 3 | 1 | 4 | 1 | 5 | % 997 = (150*10 + 5) % 997 = 508 | | | | | | | | | | |
| 5 | | 1 | 4 | 1 | 5 | 9 | % 997 = ((508 + 3*(997 - 30))*10 + 9) % 997 = 201 | | | | | | | | | |
| 6 | | | 4 | 1 | 5 | 9 | 2 | % 997 = ((201 + 1*(997 - 30))*10 + 2) % 997 = 715 | | | | | | | | |
| 7 | | | | 1 | 5 | 9 | 2 | 6 | % 997 = ((715 + 4*(997 - 30))*10 + 6) % 997 = 971 | | | | | | | |
| 8 | | | | | 5 | 9 | 2 | 6 | 5 | % 997 = ((971 + 1*(997 - 30))*10 + 5) % 997 = 442 | | | | | | |
| 9 | | | | | | 9 | 2 | 6 | 5 | 3 | % 997 = ((442 + 5*(997 - 30))*10 + 3) % 997 = 929 | | | | | |
| 10 | ← return i-M+1 = 6 | | | | | | 2 | 6 | 5 | 3 | 5 | % 997 = ((929 + 9*(997 - 30))*10 + 5) % 997 = 613 | | | | |

$-30 \pmod{997} = 997 - 30$ $10000 \pmod{997} = 30$

Rabin-Karp: Java implementation

```
public class RabinKarp
{
    private long patHash; // pattern hash value
    private int M;        // pattern length
    private long Q;       // modulus
    private int R;        // radix
    private long RM1;     //  $R^{(M-1)} \% Q$ 
```

```
    public RabinKarp(String pat) {
```

```
        M = pat.length();
```

```
        R = 256;
```

```
        Q = longRandomPrime();
```

```
        RM1 = 1;
```

```
        for (int i = 1; i <= M-1; i++)
```

```
            RM1 = (R * RM1) % Q;
```

```
        patHash = hash(pat, M);
```

```
    }
```

```
    private long hash(String key, int M)
```

```
    { /* as before */ }
```

← a large prime
(but avoid overflow)

← precompute $R^{M-1} \pmod Q$

Rabin-Karp: Java implementation (continued)

Monte Carlo version. Return match if hash match.

```
public int search(String txt)
{
    int N = txt.length();
    int txtHash = hash(txt, M);
    if (patHash == txtHash) return 0;
    for (int i = M; i < N; i++)
    {
        txtHash = (txtHash + Q - RM*txt.charAt(i-M) % Q) % Q;
        txtHash = (txtHash*R + txt.charAt(i)) % Q;
        if (patHash == txtHash) return i - M + 1;
    }
    return N;
}
```

check for hash collision
using rolling hash function

Las Vegas version. Check for substring match if hash match;
continue search if false collision.

Rabin-Karp analysis

Theory. If Q is a sufficiently large random prime (about MN^2), then the probability of a false collision is about $1 / N$.

Practice. Choose Q to be a large prime (but not so large to cause overflow). Under reasonable assumptions, probability of a collision is about $1 / Q$.

Monte Carlo version.

- Always runs in linear time.
- Extremely likely to return correct answer (but not always!).

Las Vegas version.

- Always returns correct answer.
- Extremely likely to run in linear time (but worst case is MN).

Rabin-Karp fingerprint search

Advantages.

- Extends to 2d patterns.
- Extends to finding multiple patterns.

Disadvantages.

- Arithmetic ops slower than char compares.
- Las Vegas version requires backup.
- Poor worst-case guarantee.

Substring search cost summary

Cost of searching for an M -character pattern in an N -character text.

| algorithm | version | operation count | | backup in input? | correct? | extra space |
|-------------------------|--|-----------------|---------|---------------------|------------------|----------------|
| | | guarantee | typical | | | |
| brute force | — | MN | $1.1 N$ | yes | yes | 1 |
| Knuth-Morris-Pratt | full DFA (Algorithm 5.6) | $2 N$ | $1.1 N$ | no | yes | MR |
| | mismatch transitions only | $3 N$ | $1.1 N$ | no | yes | M |
| Boyer-Moore | full algorithm | $3 N$ | N / M | yes | yes | R |
| | mismatched char heuristic only (Algorithm 5.7) | MN | N / M | yes | yes | R |
| Rabin-Karp [†] | Monte Carlo (Algorithm 5.8) | $7 N$ | $7 N$ | no | yes [†] | 1 |
| | Las Vegas | $7 N^{\dagger}$ | $7 N$ | yes | yes | 1 |

[†] probabilistic guarantee, with uniform hash function
